

Head of lights

The disco ball has lost its shine

Presentation

Head of Lights is an augmented reality game made in Unity for Meta Quest 3 headsets. The game features a shining disco ball, spinning and hanging from the ceiling while playing music.

Suddenly, the lights go off and the music stops. The disco ball has lost its shine. The user's mission is to help it recover from the inside. Using only their gaze, users are invited to light up broken stars, one by one.

Gradually, as more stars are lit, a shared brightness grows inside the disco ball and on the user's body. The music returns, layer by layer, as the brightness becomes stronger. Once all the stars are lit, the disco ball is ready to live on its own again, and it leaves the user's head. It shines again, so does the user.

Main assets: disco ball

Broken

Shining

Main assets: stars

Unlit

Shining

Experience

- 1. You are in your space. You see a disco ball spinning, shining, and playing music.**
- 2. You look around and at the disco ball. Suddenly, the lights and music turn off.**
- 3. The disco ball needs your help, and you have to enter inside it.**
- 4. A. Inside the disco ball, it is dark. Unlit stars surround you. With your gaze, they begin to shine again.
B. Each star represents a light. When turning them on, you'll also get glitter on you and create a shared brightness.
C. As you light up more stars, layers of the music return, step by step.**
- 5. At the end, you shine together with the disco ball. Once all the lights are back on and the full music is restored, the disco ball glows brightly and gently leaves your head.**

Inclusivity

Head of Lights is designed for paraplegic and tetraplegic people.

Augmented reality provides a secure environment for users by avoiding motion sickness. In this game, no body movement is required, so users who are in wheelchairs and/or unable to move their arms can play. The game duration is short, reducing any discomfort from wearing the headset for too long.

Additionally, the disco ball's spherical shape could enable its future use as a playful physiotherapy aid for paraplegics, integrated into wheelchair rotation exercises.

Future Development

If we had more time, we would have improved our game's visuals, musical elements, and overall player experience.

Our aim is to refine the visual animations for added fluidity and easier comprehension. We also planned to enhance the light and brightness effects, creating a stronger contrast between the on and off states.

Furthermore, we want to dive deeper into the game's musical rhythmic aspect by increasing the interaction between the music and the player's gaze. We also aim to let players choose their own music from a playlist featuring various genres.
